

NOTES ON ILLINOIS AND WISCONSIN RESUPINATE  
BASIDIOMYCETESANTHONY E. LIBERTA  
Illinois State University, Normal

ABSTRACT.—Four species of resupinate Basidiomycetes are reported from either Illinois or Wisconsin for the first time.

Collections of fungi that extend their known North American range are noted here. These collections were made either by me (AEL) or by R. M. Miller (RMM) and are now deposited in the mycological herbarium at Illinois State University (ISU).

*Cerinomyces pallidus* Martin

On decayed deciduous wood, Funks Grove, McLean County, Ill., VI. 20. 1969, AEL 1470 (ISU 1210); near Crab Orchard Lake, Williamson County, Ill., XI.23.1963, AEL 557 (ISU 688).

The reported North American range of this species now includes, in addition to Illinois, Iowa and Ontario (Martin, 1952) as well as Wisconsin and Colorado (Liberta, 1965, 1966).

*Galzinia incrustans* (Hoehn. & Litsch.) Parm.

On decayed deciduous wood, Funks Grove, McLean County, Ill., XII. 1.1970, RMM 70-21 (ISU 1260).

The only other midwestern state where collections of this species have been reported is Missouri, under the binomial *Corticium roseopallens* Burt (1926).

*Hypodontia alutacea* (Fr.) Eriks.

On decayed wood (*Tsuga?*), near Sayer, Vilas County, Wisconsin, VII.16. 1964, AEL 493 (ISU 1209).

This is the first report of the species in Wisconsin. Larsen (1964) has reported it from several eastern and western states

as well as from Canada. Miller and Boyle (1943) reported its occurrence in Iowa.

*Xenasma grisellum* (Bourd.) Liberta

On decayed deciduous wood, near Crab Orchard Lake, Williamson County, Illinois, XI.23.1963, AEL 1454 (ISU 1211).

This species is apparently wide spread in Europe, but the only previous North American report was from the province of Quebec, Canada (Liberta, 1966a). The collection of this species in Illinois considerably extends its known North American range.
